

Deep trees: only the quadrature kernel is still standing

Synthetic rare-indicator features (shapiq issue #545; 20,000×120, rate 0.02), where every root-to-leaf path uses as many distinct features as the tree is deep. One instance, median of ≤5 runs, single thread. Faded = still runs, but the values are wrong; × = LinAlgError; order-2 curves that stop early hit the 20 s measurement budget. LinearTreeSHAP computes Shapley values only.
